

## Only the best for your photos

The pressure on aluminum dibond and behind acrylic glass provides brilliant depth and light stability in a work of art.

- UV direct printing on acrylic glass with aluminum dibond seal
- Maximum color brilliance by UV direct printing
- Millimeter-precise size selection from 60 x 40 cm to 150 x 100 cm

## Product description

Gallery Print is the best quality process to present photos. When you request a gallery print, your photo is printed in UV direct print behind a 4 mm thick acrylic glass. Sealing is done with a 3 mm thick aluminum dibond plate.

With this process, the Gallery Print combines the depth effect of the acrylic glass with the special color brilliance of the aluminum dibond. This product will be a truly exceptional work of art in any of your homes and will inspire every viewer.

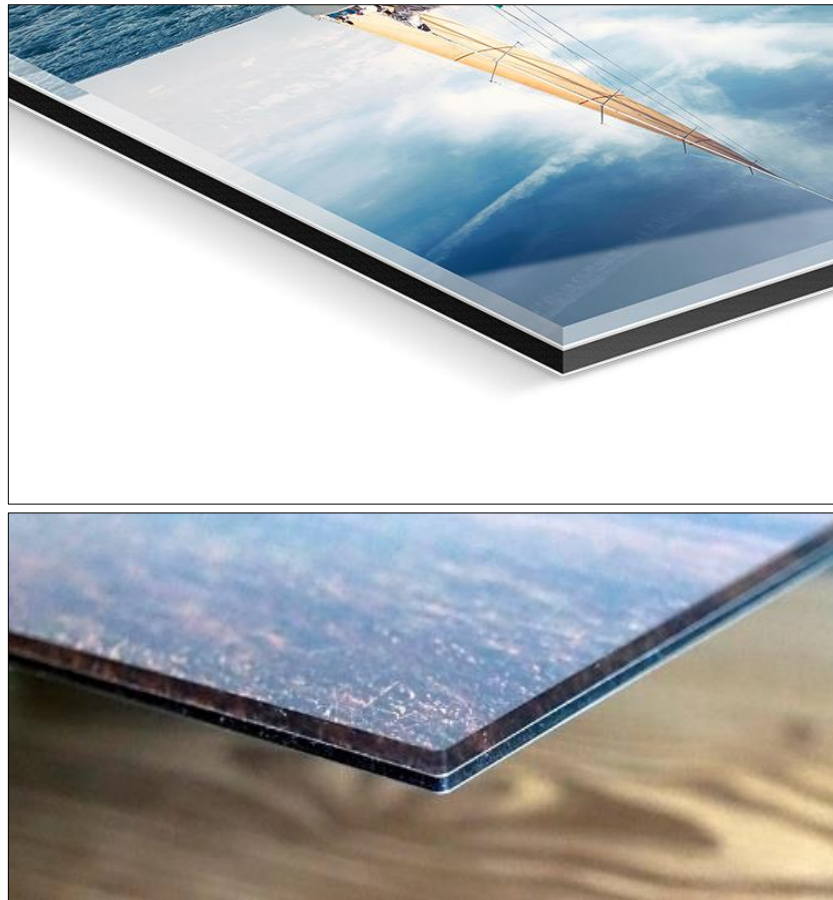

The Gallery Print is a beautiful way to print your precious photos to display in your home. Our high quality photo printing process includes UV printing directly onto acrylic glass which is then strengthened with aluminium dibond. This means the brilliance and depth of your photos are secured with the gloss of the acrylic and strength of the aluminium.

## What are the advantages of a Gallery Print?

The combination of 4 mm thick acrylic glass and a 3 mm thick aluminum dibond plate lets your photos shine brightly. The material mix looks classy and gives your four walls a gallery touch. The acrylic glass material gives your motif a long lasting UV protection, so you can admire your Gallery Print even years later.

Acrylic glass is lighter than normal glass, but it is unbreakable. Even the small details of your pictures are reproduced by acrylic glass in higher sharpness than by canvas pictures.

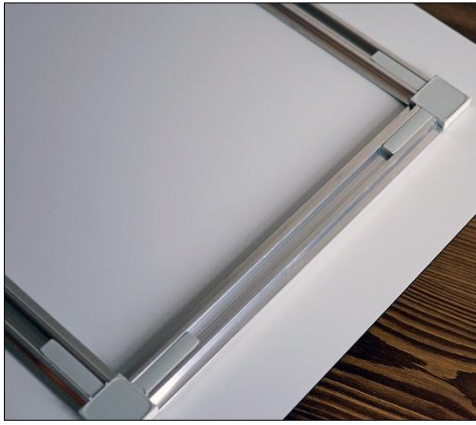

The aluminum dibond seal adds extra stability to your image. An aluminum dibond plate is a fine composite plate of two aluminum layers connected by a polyethylene core. The strong and very light material gives your favorite motif durability and shape resistance.

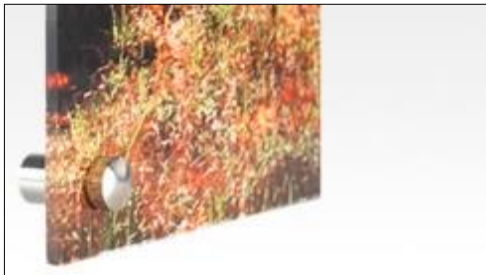

## How do you hang your Gallery Print on the wall?

There are several ways to hang your Gallery Print. Choose from the various systems the right one for your wall - they are all easy and quick to handle.

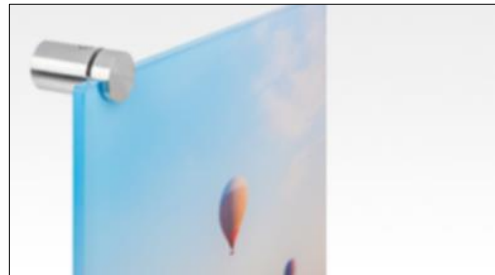

- **Clamp system without holes:** Consists of 4 wall mounts that fix picture to the wall without the need to bore holes. This system is visible from the front and provide a wall distance of approx. 2 cm
- **Bolted (screw) system:** For the suspension with a screw system, your image will receive special screws on the edges of the picture. These are drilled through the front of the print and remain visible as chrome-plated heads. All you need to do is drill holes in the wall and insert the picture with the screws. The distance to the wall in this method is about 20 mm.
- **Bar (aluminum) suspension system:** The suspension system is very common in galleries and gives your four walls a gallery charm. With this system, your image seems to float about 10 mm in front of the wall, giving it an even nobler look. An aluminum frame is glued to the back of the gallery print. Attach a screw to the desired location in your wall and hang the image on it. The continuous aluminum rail allows you to move the image to the left or right as desired. This gives you great freedom and does not have to measure millimeter-precision.
